

TEACHING ACID-BASE INTERPRETATION: WHAT IS THE BEST APPROACH?

Doug Pursley, M.Ed., RRT-ACCS, FAARC

Objectives

- ◆ 1. Discuss various simplistic, stepwise methods for interpreting the acid-base status of a patient
- ◆ 2. Describe the primary components of a comprehensive approach to assessing acid-base balance

References

- ◆ 1. All You Really Need To Know To Interpret Arterial Blood Gases, Lawrence Martin
- ◆ 2. Clinical Blood Gases, William Malley
- ◆ 3. ABG Pocket Guide, Dana Oakes
- ◆ 4. Anaesthesia Education Website
- ◆ <http://www.anaesthesiamcq.com/default.php>

Stepwise methods (classification)

- ◆ Uses systematic arrangement of values according to established criteria in order to arrive at a diagnosis

Stepwise methods

- ◆ Arrow Method (high-low)
- ◆ Variations of the arrow method
 - ◆ Tic-Tac-Toe method
 - ◆ Romanski method
 - ◆ “H” method

Arrow System

	pH	Paco ₂	HCO ₃ ⁻
Respiratory alkalosis			
Uncompensated	↑	↓	N
Partially compensated	↑	↓	↓
Fully compensated	N	↓	↓
Respiratory acidosis			
Uncompensated	↓	↑	N
Partially compensated	↓	↑	↑
Fully compensated	N	↑	↑
Metabolic acidosis			
Uncompensated	↓	N	↓
Partially compensated	↓	↓	↓
Fully compensated	N	↓	↓
Metabolic alkalosis			
Uncompensated	↑	N	↑
Partially compensated	↑	↑	↑
Fully compensated	N	↑	↑

N, Within normal range; ↑, above normal range; ↓, below normal range.

Tic-Tac-Toe method

<http://nurseslabs.com/8-step-guide-abg-analysis-tic-tac-toe-method/>

Romanski method

- ◆ Step 1: Evaluate pH
- ◆ Step 2: Evaluate respiratory and metabolic components
- ◆ Step 3: Determine consistent value
- ◆ Step 4: Determine compensation

Comprehensive approach (Interpretation)

- ◆ Uses physiologic rules and mathematical equations in order to apply a proper interpretation to the results

Teaching the Comprehensive Approach

- ◆ 1. Basic instruction about the four parts of acid-base physiology (pH, PaCO₂, HCO₃, Base) and how to check consistency/inconsistency via H-H equation
- ◆ 2. Then we teach one acid-base disorder at a time (including causes) followed by mixed disorders and case studies to put it all together. Always use patient history, electrolytes, and previous ABGs when available.

Comprehensive approach

- ◆ 3. Respiratory disorders
 - ◆ Apply rules that predict how pH and HCO_3^- change per given change in PaCO_2 in both acute and chronic conditions
- ◆ 4. Metabolic disorders
 - ◆ Examine anion and bicarbonate gaps
 - ◆ Apply rules that predict expected PaCO_2 in metabolic acidosis and alkalosis i.e. Winter's and "Point Seven Plus Twenty" rule

Consistency/Inconsistency

- ◆ All acid-base data should calculate out according to the Henderson-Hasselbalch equation
- ◆ $[\text{HCO}_3 \div (\text{PaCO}_2 \times 0.03)] \log + 6.1 = \text{pH}$

Base Excess & Calculated Bicarbonate

Calculate the serum bicarbonate from the serum pH and pCO₂.

Input pH

Input pCO₂

Calculate

Clear

HCO₃

=

Base Excess

=

The calculations above are based on the Henderson-Hasselbalch equation:

$$\text{pH} = \text{pK} + \log \frac{[\text{HCO}_3^-]}{[\text{CO}_2]}$$

Replacing pK = 6.1, and [CO₂] = 0.03 * pCO₂, and removing the logarithms to get

RULES AND EQUATIONS

Anion Gap

- ◆ $AG = (Na + K^+) - (Cl + HCO_3)$ or clinical equation...
- ◆ $AG = Na - (Cl + HCO_3)$
 - ◆ 12 is normal
 - ◆ > 20 suggests metabolic acidosis
 - ◆ > 30 is 100% chance of metabolic acidosis

Bicarbonate Gap

- ◆ $BG = \Delta AG - \Delta HCO_3$ or clinical shortcut...
- ◆ $BG = Na - Cl - 36$
 - ◆ $> +6$ suggests metabolic alkalosis or compensation for respiratory acidosis
 - ◆ < -6 suggests hyperchloremic metabolic acidosis or compensation for respiratory alkalosis

Expected PaCO₂ in metabolic acidosis and alkalosis

- ◆ Expected PaCO₂ in metabolic acidosis (Winter's formula):
 - ◆ Expected PaCO₂ = HCO₃ × 1.5 + 8 (+/- 2)
- ◆ Expected PaCO₂ in metabolic alkalosis: (Point Seven Plus Twenty rule)
 - ◆ Expected PaCO₂ = HCO₃ × 0.7 + 20 (+/- 5)

Expected changes in pH and HCO_3^- for 10 mmHg Δ in PaCO_2 starting at PaCO_2 of 40 mmHg

Condition	Acute	Chronic
Respiratory acidosis	pH ↓ by 0.06 HCO_3^- ↑ by 1 (hydrolysis)	pH ↓ by 0.03 HCO_3^- ↑ by 4
Respiratory alkalosis	pH ↑ by 0.1 HCO_3^- ↓ by 2 (hydrolysis)	pH ↑ by 0.03 HCO_3^- ↓ by 5

Case 1 - ABG and electrolytes taken from a 55 year old male with aspirin OD:

- ◆ pH 7.46
- ◆ PaCO₂ 19
 - ◆ Expected PaCO₂ = 27
- ◆ HCO₃ 13
- ◆ Na 146
- ◆ Cl 106
- ◆ AG = 27
- ◆ BG = +4
- ◆ Arrow method: partially compensated respiratory alkalosis.
- ◆ Actual interpretation is metabolic acidosis with respiratory OVER compensation (respiratory alkalosis)

Case 2 - 66 year old male with chronic hypercapnia (PaCO₂ 75-85) and NG tube

- ◆ pH 7.45
- ◆ PaCO₂ 79
- ◆ HCO₃ 53
 - ◆ Expected HCO₃ for this degree of chronic hypercapnia is 40
- ◆ Na 144
- ◆ Cl 79
- ◆ AG = 12
- ◆ BG = +29
- ◆ In spite of clinical scenario, stepwise methods classify these values as compensated metabolic alkalosis
- ◆ Actual interpretation is chronic hypercarbia AND metabolic alkalosis

Case 3 - 36 year old female presents to the ED with pain and anxiety

- ◆ pH 7.58
- ◆ PaCO₂ 22
- ◆ HCO₃ 19.9
- ◆ Base -1.7
- ◆ Arrow: partially compensated respiratory alkalosis
- ◆ Actual interpretation is acute respiratory alkalosis. HCO₃ dropped from hydrolysis.

Also, in single acid-base disorders, a base excess/deficit in the normal range would rule out partial compensation.

Case 4 – 71 year old end-stage COPD with suspected pneumonia. His steady-state values are normally 7.31/73/36/+9. ABGs in the ED are:

- ♦ pH 7.43
- ♦ PaCO₂ 53
- ♦ HCO₃ 34
- ♦ Base +9
- ♦ Stepwise methods (because they don't consider history) classify these values as compensated metabolic alkalosis
- ♦ Actual interpretation is acute hypocapnia superimposed on chronic respiratory acidosis.

Case 5 - A adult male patient is brought to the ER has the following ABG on a nasal cannula at 2 l/m:

- 3:49 am
 - pH 6.83
 - PaCO₂ 139
 - PaO₂ 138
 - HCO₃ 22
 - Base -10
- ◆ Arrow: acute respiratory acidosis
 - ◆ Actual interpretation: mixed respiratory and metabolic acidosis

Case 5 continued - A second ABG is taken 23 minutes later while the patient is being manually ventilated:

- | | |
|-------------------------|------------------------|
| • 3:49 am | • 4:12 am |
| • pH 6.83 | • pH 7.19 |
| • PaCO ₂ 139 | • PaCO ₂ 45 |
| • HCO ₃ 22 | • HCO ₃ 17 |
| • Base -10 | • Base -10 |

Good work by the respiratory therapist!!!
Also, good example of hydrolysis.

Case 6 – 23 year old man being evaluated in the ED for severe pneumonia. Respiratory rate is 38 and he is using accessory muscles.

- ◆ pH 7.29
- ◆ PaCO₂ 55
- ◆ HCO₃ 26
- ◆ Base -1
- ◆ PaO₂ 47
- ◆ Na 154
- ◆ Cl 100
- ◆ AG 28
- ◆ BG +18
- ◆ Stepwise: acute respiratory acidosis
- ◆ Actual interpretation: respiratory acidosis + metabolic acidosis + metabolic alkalosis
- ◆ Note in this situation that base is normal from competing metabolic acidosis and alkalosis

Case 7 – 24 year old DKA

- ◆ pH 7.17
- ◆ PaCO₂ 17
- ◆ HCO₃ 6
- ◆ Base -20
- ◆ Stepwise: partially compensated metabolic acidosis
- ◆ Actual interpretation: maximally and appropriately compensated metabolic acidosis.

Last two digits rule and Winter's indicate maximal compensation in this patient.

Case 8 – 18 year old female, previously healthy, opioid OD

- ◆ pH 7.19
- ◆ PaCO₂ 60
- ◆ HCO₃ 22
- ◆ Stepwise: acute respiratory acidosis
- ◆ Actual interpretation: mixed respiratory and metabolic acidosis. Base is -5
- ◆ If acute, HCO₃ should be 26 from hydrolysis
- ◆ HCO₃ is lower than it should be from the metabolic acidosis

Case 9 – 64 year old woman admitted to the ED with renal failure and vomiting

- ◆ pH 7.40
- ◆ PaCO₂ 38
- ◆ HCO₃ 23
- ◆ Na 149
- ◆ K⁺ 2.8
- ◆ Cl 100
- ◆ Creatinine 8.7 mg/dl
- ◆ AG 26
- ◆ BG +13
- ◆ Stepwise: normal
- ◆ Actual interpretation: coexistent metabolic acidosis and metabolic alkalosis.

Case 10 – Previously healthy, 56 year old man in the recovery room following cholecystectomy

- ◆ pH 7.22
- ◆ PaCO₂ 70
- ◆ HCO₃ 27.7
- ◆ Base +0.5
- ◆ Stepwise: partially compensated respiratory acidosis
- ◆ Actual interpretation: acute respiratory acidosis. HCO₃ elevated from hydrolysis. Base is normal. If truly partially compensated, there would be a base excess.

Case 11 – Patient with chronic hypercapnia and hypokalemia

- ◆ pH 7.40
- ◆ PaCO₂ 60
- ◆ HCO₃ 36
- ◆ Stepwise: compensated respiratory acidosis OR compensated metabolic alkalosis. Could not distinguish with pH 7.40
- ◆ Actual interpretation: primary respiratory acidosis AND primary metabolic alkalosis. Base is +11.

If this were a single metabolic alkalosis the PaCO₂ would only compensate 45 according to the “Point Seven Plus Twenty” rule. HCO₃ is higher from primary metabolic alkalosis.

Conclusion/Summary

- ◆ A proper acid-base diagnosis is vital to guide treatment decisions at the bedside
- ◆ Many patients have very complex acid-base disturbances
- ◆ Stepwise methods such as the arrow method OVER simplify acid-base interpretation
- ◆ We owe it to our students to give them all the tools to properly interpret arterial blood gases!
